#Worksheet for R Programming

Instructions:

• Use RStudio or the RStudio Cloud accomplish this worksheet. • Save the R script as RWorksheet_lastname#7a.R. • On your own GitHub repository, push the R script, the Rmd file, as well as this pdf worksheet to the repo you have created before. • Do not forget to comment your Git repo on our VLE • Accomplish this worksheet by answering the questions being asked and writing the code manually.

Basic Statistics

1. Create a data frame for the table below.

```
Student_Scores <- data.frame (c(Students <- 1:10), c(Pre_test <- 55, 54, 47, 57, 51, 61, 57, 54, 63, 58)
colnames(Student_Scores) <- c('Students','Pre-test','Post-test')
Student_Scores
```

```
##    Students Pre-test Post-test
## 1         1       55        61
## 2         2       54        60
## 3         3       47        56
## 4         4       57        63
## 5         5       51        56
## 6         6       61        63
## 7         7       57        59
## 8         8       54        56
## 9         9       63        62
## 10       10       58        61
```

a. Compute the descriptive statistics using different packages (Hmisc and pastecs). Write the codes and its result.

```
library(Hmisc)
```

```
## Warning: package 'Hmisc' was built under R version 4.2.2
```

```
## Loading required package: lattice
```

```
## Loading required package: survival
```

```

```

2. The Department of Agriculture was studying the effects of several levels of a fertilizer on the growth of a plant. For some analyses, it might be useful to convert the fertilizer levels to an ordered factor. • The data were 10,10,10, 20,20,50,10,20,10,50,20,50,20,10.

```
AgriDep <- c(10,10,10,20,20,50,10,
             20,10,50,20,50,20,10)
```

a. Write the codes and describe the result.

```
AgriDep_Order <- sort(AgriDep, decreasing = FALSE)
AgriDep_Order
```

```
##  [1] 10 10 10 10 10 10 20 20 20 20 20 50 50 50
```

```
describe(AgriDep_Order)
```

```
## AgriDep_Order
##        n  missing distinct     Info     Mean      Gmd
##       14        0        3     0.87    22.14    16.15
##
## Value         10    20    50
## Frequency      6     5     3
## Proportion 0.429 0.357 0.214
```

3. Abdul Hassan, president of Floor Coverings Unlimited, has asked you to study the exercise levels undertaken by 10 subjects were “l”, “n”, “n”, “i”, “l” , “l”, “n”, “n”, “i”, “l” ; n=none, l=light, i=intense

```
Excer_Levels <- c("l","n","n","i","l","l","n","n","i","l")
class(Excer_Levels)
```

```
## [1] "character"
```

a. What is the best way to represent this in R?

```
Represent <- factor(Excer_Levels)
Represent
```

```
##  [1] l n n i l l n n i l
## Levels: i l n
```

4. Sample of 30 tax accountants from all the states and territories of Australia and their individual state of origin is specified by a character vector of state mnemonics as:

```
state <- c("tas", "sa", "qld", "nsw", "nsw", "nt", "wa", "wa", "qld",
"vic", "nsw", "vic", "qld", "qld", "sa", "tas", "sa", "nt",
"wa", "vic", "qld", "nsw", "nsw", "wa", "sa", "act", "nsw",
"vic", "vic", "act")
```

a. Apply the factor function and factor level. Describe the results.

```
Results <- factor(state)
Results
```

```
##  [1] tas sa  qld nsw nsw nt  wa  wa  qld vic nsw vic qld qld sa  tas sa  nt  wa
## [20] vic qld nsw nsw wa  sa  act nsw vic vic act
## Levels: act nsw nt qld sa tas vic wa
```

5. From #4 - continuation:

• Suppose we have the incomes of the same tax accountants in another vector (in suitably large units of money)

```
incomes <- c(60, 49, 40, 61, 64, 60, 59, 54,
62, 69, 70, 42, 56, 61, 61, 61, 58, 51, 48,
65, 49, 49, 41, 48, 52, 46, 59, 46, 58, 43)
```

a. Calculate the sample mean income for each state we can now use the special function tapply(): Example: giving a means vector with the components labelled by the levels

incmeans <- tapply(incomes, statef, mean)

Note: The function tapply() is used to apply a function, here mean(), to each group of components of the first argument, here incomes, defined by the levels of the second component, here statef 2 that tapply() also works in this case when its second argument is not a factor, • e.g., 'tapply(incomes, state)', and this is true for quite a few other functions, since arguments are coerced to factors when necessary (using as.factor()).

```r
ApplyT <- tapply(state, incomes, mean)
```

```
## Warning in mean.default(X[[i]], ...): argument is not numeric or logical:
## returning NA

```

```
ApplyT
```

```
## 40 41 42 43 46 48 49 51 52 54 56 58 59 60 61 62 64 65 69 70
## NA NA NA NA NA NA NA NA NA NA NA NA NA NA NA NA NA NA NA NA
```

b. Copy the results and interpret.

- 40 41 42 43 46 48 49 51 52 54 56 58 59 60 61 62 64 65 69 70 NA NA NA NA NA NA NA NA NA NA NA NA NA NA NA NA NA NA NA NA

6. Calculate the standard errors of the state income means (refer again to number 3)

```
stdError <- function(x) sqrt(var(x)/length(x))
```

Note: After this assignment, the standard errors are calculated by:

incster <- tapply(incomes, statef, stdError)

```
CalcLength <- length(ApplyT)
CalcSD <- sd(ApplyT)
CalcAll <- CalcLength/sqrt(CalcSD)
CalcAll
```

```
## [1] NA
```

a. What is the standard error? Write the codes.

-[1] NA

b. Interpret the result.

-Argument is not numeric or logical

7. Use the titanic dataset.

```
Sob <- data.frame(Titanic)
```

a. subset the titatic dataset of those who survived and not survived. Show the codes and its result.

```
Sobset <- subset(Sob, select = "Survived")
Sobset
```

```
##    Survived
## 1        No
## 2        No
## 3        No

## 21      Yes
## 22      Yes
## 23      Yes
## 24      Yes
## 25      Yes
## 26      Yes
## 27      Yes
## 28      Yes
## 29      Yes
## 30      Yes
## 31      Yes
## 32      Yes
```

8. The data sets are about the breast cancer Wisconsin. The samples arrive periodically as Dr. Wolberg reports his clinical cases. The database therefore reflects this chronological grouping of the data. You can create this dataset in Microsoft Excel. Figure 2: Breast Cancer 1 Figure 3: Breast Cancer 2 Figure 4: Breast Cancer 3

a. describe what is the dataset all about.

- The dataset s all about Breast Cancer.

b. Import the data from MS Excel. Copy the codes.

```
library("readxl")
```

```
## Warning: package 'readxl' was built under R version 4.2.2
```

```
BC_Data <- read_excel("C:\\Users\\User\\Documents\\Worksheet 7//Breast Cancer.xlsx")
